LEGAL DEPARTMENT

January 14, 1966

Mr. Walter M. Schaefer
Food and Drug Officer
Petitions Control Branch
Food and Drug Administration
Department of Health, Education and Welfare
Washington, D. C. 20204

Dear Mr. Schaefer:

Food Additive Petition No. 5B1747

It was recommended that 90-day feeding studies in the rat and dog be undertaken to assist you in evaluating the above Petition. These studies have been completed and we are hereby enclosing for filing three copies each of the following studies:

Ninety-Day Feeding Study of (b) (4)
Paper Fluorodizer in the Rat by
International Research and Development
Corporation dated November 30, 1965;

Ninety-Day Feeding Study of (b) (4)
Paper Fluorodizer in the Dog by
International Research and Development
Corporation dated November 30, 1965.

These studies substantiate the toxicity data originally filed with the Petition and indicate that the proposed use is not hazardous.

We hope you will now be able to make a final determination on the Petition.

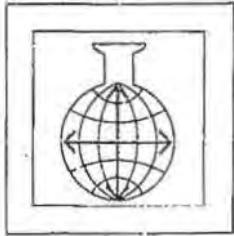

Very truly yours,

RHR:df
Encs. Richard H. Rea PCP

I. Py Aesis

In a 90-day oral toxicity study (b) (4) was fed 7 days each week to male and female beagle dogs at dietary levels of 100, 500 or 2500 ppm. After 35 days of feeding, the 500 ppm. and 2500 ppm. dietary levels were increased to 1000 ppm. and 5000 ppm., respectively for the duration of the 90 days of treatment.

No pharmacodynamic and/or gross toxic signs were observed. Detailed physical examination revealed all dogs to be essentially normal.

No adverse body weight changes occurred among any dogs used for this study. Food consumption values remained relatively constant, and average daily water intake and urine output were not meaningfully different from values obtained in the control period.

No alterations in hematologic parameters were observed which could be related to feeding the test compound.

No biologically meaningful changes occurred with respect to plasma glucose, protein, albumin, urea nitrogen or albumin-to-globulin ratios.

A biologically significant increase in plasma cholesterol was found for 5-of-6 dogs at the 2500 ppm. dietary level. 

Prothrombin time determinations and serum glutamic pyruvic transaminase (SGPT) and serum glutamic oxalacetic transaminase (SGOT) activities remained within the usual ranges at all periods of measurement. Alkaline phosphatase activities exhibited an upward trend in 2 of 6 dogs at the high dietary level.

Urinalysis did not reveal compound-related changes at any period of examination.

125-017

000038

International Research and Development Corporation

Page 2

Although no gross compound-related lesions were observed at necropsy, a slight compound-related liver weight increase occurred at the middle and high dietary levels. Compound-related microscopic lesions consisted of hypertrophy of centrolobular liver parenchymal cells in 4-of-6 dogs from the 5000 ppm. dietary level group. No compound-related lesions were seen in other tissues from these dogs or in livers from dogs at the lower dietary levels.

Page 3

II. COMPOUND

The test compound was received from E. I. duPont de Nemours and Company, Wilmington, Delaware, on June 19, 1965. It was a brown amorphous solid in containers bearing the label "MPD-3110A - (b) (4).
(b) Active Ingredient, Haskell No. 4212."

III. CLINICAL STUDIES

A. METHODS:

1. General Procedure:

Twelve male and 12 female young, purebred beagle dogs in apparent good health, were used for a 90-day feeding study of (b) (4)

The dogs were separated into one control and 3 treated groups of 3 males and 3 females each, and were housed individually in metabolism cages in temperature and humidity controlled quarters throughout the course of study. Powdered Purina Dog Chow without (b) (4) and the same chow with the prescribed dietary levels of the test compound were available, as was water, at all times to the respective groups of dogs. Food consumption and individual body weights were measured and recorded once each week. Water intake and urine output were measured and recorded daily during each clinical laboratory test interval week.

Prior to the initiation of the compound administration phase of this study, stool flotation studies were conducted for the detection of intestinal parasites. Positive findings were followed by appropriate vermifuge therapy.

During the control period and again during the period of compound administration, all dogs were subjected to detailed physical examination. Heart sounds were examined by five point auscultation; pulse rates were determined by palpation; the ocular fundi were viewed for abnormalities; and reflexes were evaluated.

In addition to the routine physical examination described above, all dogs were observed several times daily, 7 days each week, for signs of pharmacodynamic and/or toxic effects.

125-017

000041

International Research and Development Corporation

Page 5

After 90 consecutive days of compound administration, all dogs were sacrificed and subjected to necropsy examination. (see section on Pathology for detailed methodology.)

2. Laboratory Tests:

At least 3 times during the control period, and again after 1, 2 and 3 months of compound administration, blood and 24-hour urine samples were obtained for clinical laboratory studies.

a. Hematology:

Routine hematologic studies included total¹ and differential leucocyte counts, hematocrits², hemoglobin concentrations³, erythrocyte sedimentation rates⁴, and total erythrocyte counts¹.

b. Biochemical Studies:

(1) Plasma: Chemical determination on plasma routinely included quantitative tests for glucose⁵, total protein⁶, total albumin⁷, and urea nitrogen⁸. Albumin-to-globulin ratios were calculated.

(2) Liver Function: Plasma alkaline phosphatase activity⁹, prothrombin time¹⁰ determinations, serum glutamic oxalacetic (SGOT) and serum glutamic pyruvic (SGPT) transaminase activities¹¹, and cholesterol¹² determinations, were used as an indication of liver function. In addition, serum albumin electrophoretic patterns (cellulose strip method) were obtained once during the control period and again after one and 3 months of compound administration¹³.

(3) Urinalysis: Observations for abnormalities in gross appearance and color and qualitative tests for the detection of bilirubin¹⁴, occult blood,^{15,16,17} albumin^{18,19,20,21} and glucose,^{21,22,23} were conducted on the 24-hour urine specimen. Urinary pH,²⁴ specific gravity and volume were measured, and the urinary sediments were examined microscopically.

c. Special Sampling:

Twenty-four hour urine and fecal samples were obtained from all dogs during the period of compound administration. These were frozen and delivered to the sponsor for analysis of (b) (4) content. Similarly, representative tissue samples (see section on Pathology) were provided following necropsy examination.

3. Compound Administration:

The test compound (b) (4) was incorporated into the basic laboratory diet (powdered Purina Dog Chow) and fed to the respective groups of dogs throughout the study. The 3 treated groups of dogs were fed diets containing (b) (4) at initial concentrations of 100, 500, or 2500 ppm. for a continuous period of 35 days. From the 6th week of compound administration to the termination of the study the 500 ppm. dietary level was increased to 1000 ppm. and the 2500 ppm. dietary level was increased to 5000 ppm. The dogs at the lowest dietary level continued to receive a diet containing 100 ppm. of the test agent throughout the study. The diets were freshly prepared each week and were constantly available to the dogs in self-feeding hoppers.

The control group of 3 male and 3 female dogs was maintained on a regimen identical to that of the treated groups except that the powdered basic laboratory diet did not contain (b) (4).

B. RESULTS:

1. Behavior, Appearance and Mortality:

No alterations in behavior or appearance which could be considered to be compound-related were seen among any of the control or treated dogs employed in this study.

Incidental alterations included one female dog (65-038) in

125-017

000044

International Research and Development Corporation

Page 8

the control group that exhibited 3 small 1-to-2 cm. areas of alopecia on the back throughout the study; one male dog (65-072, 100 ppm.) that exhibited slight alopecia of the right rear leg during the last half of the study; one female dog (65-085, 100 ppm.) that exhibited an enlarged right Harderian gland throughout the study; one male dog (65-087, 1000 ppm.) that exhibited conjunctivitis and opacity of the right cornea during the last 4 compound administration weeks; and one female dog (65-094, 1000 ppm.) that exhibited slight dermatitis of the right foreleg during the last month of compound administration.

All dogs survived the 90-day period of compound administration.

2. Physical Examination:

Routine physical examinations conducted during the study revealed all dogs to be essentially normal in behavior and appearance at all times. Heart sounds were not unusual; pulse rates were normal; reflexes were unimpaired and fundascopic examination of the eyegrounds revealed no changes.

3. Body Weight (Table 1):

All control and treated dogs exhibited essentially normal body weights throughout the 90-day period of treatment. No differences in body weight gain were seen between the control and the treated groups of dogs.

4. Food Consumption (Table 2):

All dogs consumed essentially the same quantities of food each week during the compound administration period as they did during the control period. No differences in food consumption were seen between the control and the treated groups of dogs.

125-017

000045

International Research and Development Corporation

Page 9

5. Compound Consumption:

Compound consumption was calculated in mg./kg./day based on the average food consumption and body weight of each animal. The results of these calculations appear in Table 3.

6. Water Intake and Urine Output (Table 4):

Although considerable variation in average daily water intake and urine output was found for most dogs employed in this study, the values obtained during the period of treatment were not consistently different from values obtained during the corresponding control period. No biologically meaningful differences were found between the control and test animals.

7. Laboratory Tests (Tables 5 through 28-A):

a. Hematology:

No compound-related hematologic changes occurred among dogs used for this study.

Incidental changes, not related to compound administration, included low borderline hemoglobin and hematocrit values and mild to marked hypochromasia of the erythrocytes. The incidence of occurrence was similarly distributed in the control and treated groups, particularly in the control examination periods and in the first examination (1 month) interval after the beginning of treatment. These values tended to fall into the usual acceptable ranges as the study progressed.

An elevated total leucocyte count was observed in Dog 65-083 (control; male) and Dog 65-078 (male; 500 ppm.) in the final control examination period prior to treatment, and Dog 65-092 (female; 500 ppm.) after 3 months of compound administration.

A decrease in the polymorphonuclear leucocyte-to-lymphocyte

125-017

000046

International Research and Development Corporation

Page 10

ratio was observed at one or more periods of examination in 3-of-6 control dogs and 9-of-18 treated dogs during the period of study.

An occasional elevation in erythrocyte sedimentation rate was observed in the control and treated groups of dogs at one of the control periods of examination. One dog (65-187, male; 500 ppm.) exhibited an elevation in this parameter in the treatment period. This was observed at the 60-day examination period and had returned to normal by the terminal examination.

b. Biochemical Studies:

(1) Plasma: No compound-related changes in plasma biochemistry were found among dogs used for this study.

(2) Liver Function Tests: A dose-related increase in plasma cholesterol was found in 5-of-6 dogs after 3 months of compound administration at the 2500 - 5000 ppm. level. No consistent biologically meaningful changes in plasma cholesterol were found at the lower dietary levels (Table 2B-A).

In addition, a slight upward trend in plasma alkaline phosphatase activity was noted for Dogs 65-090 (male) and 65-099 (male) at the 2500 - 5000 ppm. level.

Prothrombin time determinations and serum glutamic pyruvic transaminase (SGPT) and serum glutamic oxalacetic transaminase (SGOT) values remained within the usual acceptable ranges at all periods of examination for all groups of dogs in this study. No unusual changes were noted in the serum albumin electrophoretic patterns.

(3) Urinalysis: Urinalysis examination failed to reveal changes which were considered to be related to treatment with (b) (4)

125-017

000047

International Research and Development Corporation

Page 11

Incidental findings, not related to compound administration, included slight bilirubinuria for one control (65-086, male) and 3 treated (65-078, 65-079 and 65-087, males) dogs at the 2-month examination period. Bilirubinuria again was found at the terminal examination, for one of these dogs (65-079, male; 500 - 1000 ppm.)

Page 12

IV. PATHOLOGICAL STUDIES

A. METHODS:

1. Gross Examination:

At the completion of the compound administration period, all dogs were anesthetized with sodium pentobarbital, sacrificed by exsanguination and subjected to necropsy examination. Major organs were weighed and representative tissues were collected into 10 per cent buffered neutral formalin for subsequent histologic processing and microscopic examination. Fresh specimens of brain, liver, kidneys, spleen, fat, muscle, testes and blood were collected from each dog, frozen and forwarded to the sponsor.

2. Microscopic Examination:

The following tissues from each of the control and 5000 ppm. dosage group dogs were paraffin embedded, sectioned, stained with hematoxylin and eosin and examined microscopically:

brain	aorta	pancreas
spinal cord	spleen	liver
peripheral nerve	lymph node	gall bladder
eye	thymus	kidney
pituitary	bone marrow	urinary bladder
thyroid	salivary gland	testes or ovary
parathyroid	esophagus	prostate or uterus
adrenal	stomach	skeletal muscle
trachea	small intestine	skin
lung	large intestine	bone
heart		

Liver sections from all 100 and 1000 ppm. dosage level dogs were also processed as above and examined microscopically.

125-017

000049

International Research and Development Corporation

Page 13

B. RESULTS:

1. Gross Pathology (Table 29) and Organ Weights (Table 30):

No compound-related gross pathologic lesions were observed in any dogs subjected to necropsy examination. Organ weights of treated dogs were within the normal range except the liver weights of the 5000 ppm. dosage group dogs which were slightly increased. The liver weights of the 1000 ppm. dosage group dogs were also greater than the liver weights of the control dogs in this study although they were still within the normal range.

2. Histopathology (Tables 31 and 32):

Compound-related changes were limited to the liver of 3-of-3 male and 1-of-3 female dogs from the 5000 ppm. dosage level group. These changes consisted of slight hypertrophy of centrolobular parenchymal cells. The cytoplasm of affected cells was more homogeneous and less coarsely granular than the cytoplasm of hepatocytes at the periphery of the lobule or of hepatocytes in control livers. These changes were not seen in any of the livers from the 10G or 1000 ppm. dosage level dogs.

Ninety-Day Feeding Study in the Dog.

TABLE 29. Necropsy Observations.

Animal Number	Sex	Organ	Comment
<u>Control:</u>			
65-070	M	small intestine ileocolic junction cecum, colon	Few hookworms present. Mild mucosal congestion. Few 2 to 3 mm. hemorrhages.
65-083	M	small intestine	Ascarid.
65-086	M	ileocolic junction cecum urinary bladder heart	Mild mucosal congestion. Several 2 to 3 mm. mucosal hemorrhages. Few petechial hemorrhages. Tricuspid valve, 2 mm. hematoma.
65-088	F	cecum	Few petechiae in the mucosa.
65-081	F	ileocolic junction colon	Mild mucosal congestion. Several mucosal petechiae.
65-093	F	small intestine	Few petechial hemorrhages at the gastroduodenal junction, fecal material was present in the stomach.
<u>100 ppm.:</u>			
65-072	M	ileocolic junction urinary bladder	Mucosal congestion. Petechial hemorrhages at the neck.
65-074	M	small intestine ileocolic junction	Few hookworms present. Mild mucosal congestion.
65-076	M	urinary bladder	Area of hyperemia at neck.
65-077	F	small intestine	Areas of hyperemia at ileocolic orifice.
65-085	F	small intestine cecum, colon	3 mm. raised firm area in the duodenum; terminal portion of the ileum had mild mucosal hemorrhage at the ileocolic junction. Mild mucosal hemorrhage.
65-091	F	stomach ileocolic junction cecum, colon	Fecal material present in the stomach. Mild mucosal congestion. Several 2 mm. areas of hemorrhage in the mucosa.

I. SYNOPSIS

In a 90-day feeding study, male and female albino rats were fed diets containing [REDACTED] at levels of 100, 500 or 2500 ppm. After 35 days of continuous feeding, the 500 and 2500 ppm. dietary levels were increased to 1000 and 5000 ppm., respectively for the remainder of the study. After the prescribed 90-day period of compound administration, representative animals were placed on a withdrawal study.

All rats appeared essentially normal with respect to behavior and appearance throughout the study.

No adverse effect on body weight gain was found at any dietary level employed in this study, both in the active compound administration phase and in the withdrawal period.

Average total weekly food consumption measured in grams/rat/week in those groups fed 100 and 500 - 1000 ppm. of (b) (4) in the diet compared favorably with the control rats throughout the study. At the 2500 - 5000 ppm. dietary level, food consumption of the male rats ranged from 1.1 to 8.7 per cent less than control male rats, and food consumption of the female rats ranged from 5.2 to 16.4 per cent less than the female control rats. These differences were first noted in the 8th week for males and in the 4th week for females and continued throughout the treatment period.

No meaningful differences in food consumption were reflected by the treated groups of rats in comparison to the control group on the basis of grams of food consumed per day per kilogram of body weight.

No compound-related hematologic or biochemical changes were found

125-016

000095

International Research and Development Corporation

Page 2

at the 100 and 500 - 1000 ppm. dietary levels of (b) (4). However, slightly decreased values for erythrocyte counts, hematocrits and hemoglobin concentrations were found for males and females at the 2500 - 5000 ppm. level, particularly at the terminal (90-day) clinicopathology examination. Urinalyses were normal at all times.

Compound-related changes observed at the 90-day necropsy examination consisted of increased liver and kidney weight at the 1000 and 5000 ppm. dosage levels and pale yellowish livers in some male rats from the 500 - 1000 and 2500 - 5000 ppm. dosage levels. In histologic section, only livers from the 2500 - 5000 ppm. dosage level showed any change and this consisted of a slight hypertrophy of centrolobular hepatocytes. The increase in liver and kidney weights and centrolobular hepatocyte hypertrophy persisted with diminished magnitude through 21 days of compound withdrawal. Similar organ weight and histologic changes were observed at the 30 and 60-day interim sacrifices.

II. COMPOUND

The test compound was received from E. I. duPont de Nemours and Company, Wilmington, Delaware, on June 19, 1965. It was a brown amorphous solid in containers bearing the label "MPD-3110A - (b) (4)
(b) Active Ingredient, Haskell & Co. 4212."

III. CLINICAL STUDIES:

A. METHODS:

1. General Procedure:

Eighty male (weighing from 45 to 64 grams) and eighty female (weighing from 47 to 63 grams) albino rats of the Charles River strain were used for this study.

The rats were housed individually in cages suspended above the droppings in an air-conditioned room throughout the study and were fed a diet of Purina Laboratory Chow for rats ad libitum. Water also was available at all times.

The animals were divided into one control group and three treated groups of 20 male and 20 female rats each.

The rats in each sex group were selected so that the average body weight of each group was similar to that of the other groups of the same sex.

2. Compound Administration:

(b) (4) was incorporated into the standard powdered laboratory diet of Purina Laboratory Chow and offered to the treated groups of rats ad libitum. The test diet was freshly prepared each week and the compound-in-diet levels mixed so that the rats received (b) (4) at dietary levels of 100, 500, or 2500 ppm. In the sixth week of compound administration those groups receiving 500 or 2500 ppm. were increased in concentration to dietary levels of 1000 or 5000 ppm., respectively. Those animals receiving 100 ppm. of (b) (4) in the diet continued to receive this level throughout the 13-week study period.

The control groups of rats received the powdered diet of Purina Laboratory Chow, but without (b) (4)

125-016

000098

International Research and Development Corporation

Page 5

Following 13 weeks of compound administration rats in all groups were sacrificed and subjected to necropsy examination with the exception of certain selected animals from the control group and from the treated groups at the 1000 and 5000 ppm. dietary levels which were continued on study in a compound withdrawal phase. The withdrawal phase of this study will be reported in its entirety in a subsequent and separate report.

3. Observations:

The control and test animals were observed daily for mortality, alteration in general appearance and behavior, and signs of pharmacodynamic and/or toxic effects.

Body weights, food consumption, and food efficiency values were recorded for each rat weekly throughout the study.

4. Laboratory Tests:

a. Hematology:

Hematologic examination consisted of erythrocyte counts, total¹ and differential leucocyte counts, hematocrits², and hemoglobin³ concentrations. These studies were performed individually on 6 male and 6 female rats randomly selected in the control and each test group during the control period and again at 30, 60, and 90 days.

b. Urinalysis:

Urine samples were obtained from the same animals at the same time intervals used to obtain blood for hematology. Urinalysis

consisted of qualitative tests for glucose,^{4,5,6} bilirubin⁷, occult blood,^{8,9,10} and albumin,^{4,11,12,13} measurements of volume, pH¹⁴ and specific gravity, and microscopic examination of the urinary sediments.

c. Biochemistry:

Biochemical examinations were conducted at the same intervals as for hematology. Serum transaminase (SGOT and SGPT)¹⁵ and plasma alkaline phosphatase determinations¹⁶ were performed on 6 male

and 6 female rats randomly selected from the control and treated groups. The animals chosen for hematology values were not used for these biochemical determinations.

B. RESULTS:

1. General Behavior and Appearance:

No adverse changes in behavior or appearance were encountered that could be related to the administration of (b) (4).

Animals in the control and all treated groups appeared essentially normal each day with the exception of an occasional rat in each group that exhibited slight nasal and/or ocular porphyrin discharge.

Other incidental findings, unrelated to compound administration, included one treated female animal (Rat #14374) at the 5000 ppm. dietary level which exhibited a swollen nose in the 13th week of study, one treated male (Rat #14298) at this dietary level which exhibited a mass on the flank from the 16th week (withdrawal period) until terminal necropsy examination, and one treated male (Rat #14324) at this same dietary level which exhibited destruction of the right eye, from the 15th week to the terminal (in the withdrawal period) necropsy examination.

2. Body Weights (Tables 1-8 and Figures 1 and 2):

a. Control:

The control animals maintained body weight curves which were consistent with those curves exhibited by control animals of the same age and strain maintained in these laboratories from time-to-time.

b. 100 and 500 ppm.*:

Male and female rats at these dietary levels maintained body weights which paralleled closely those of their respective control groups.

* 500 ppm. dietary level increased to 1000 ppm. in the 6th week of study.

International Research and Development Corporation

Page 8

c. 2500 ppm.**:

No marked body weight changes occurred among male and female rats at this dietary level during the course of compound administration. Male animals in the 9th week exhibited a body weight gain 8.8 per cent less than control males. This difference in body weight gain persisted for the duration of the study period. During the withdrawal phase of this study the greatest decrease in body weight gain occurred. Even then, however, this difference was only about 10 per cent less than that of the male control animals.

Female treated animals in this group in the 7th week of study exhibited a weight gain which was 11.5 per cent less than that of the control female animals. This difference in body weight gain persisted for the duration of the treatment period. The greatest difference in body weight gain of the female group was noted in the 12th week of study at which time a difference of only 11.7 per cent occurred.

3. Food Consumption (Tables 10 and 11):

a. Grams/Rat/Week:

Average total weekly food consumption for male and female rats in those groups receiving 100 ppm. and 500 ppm.* compared favorably with similar measurements obtained from the control group.

Treated rats receiving 2500 ppm.** showed food consumption values less than those of control animals beginning in the 4th week for treated females and in the 8th week for treated males. This decrease in food consumption continued throughout the study period and ranged from 1.1 to 8.7 per cent for the males and 5.2 to 16.4 per cent for the females in this group. The decreased food consumption in this

* 500 ppm. dietary level increased to 1000 ppm. in the 6th week of study.
** 2500 ppm. dietary level increased to 5000 ppm. in the 6th week of study.

International Research and Development Corporation

Page 9

group continued in both sexes for the duration of the treatment period.

b. Grams/Kg./Day:

No biologically meaningful differences were observed on food consumption in the treated groups of rats when compared with the control group on a basis of grams/kg./day food consumed.

4. Survival (Table 9.):

Other than for those animals subjected to interim necropsy examination at 30 and 60 days, all control and treated animals survived the course of study with two exceptions. One control female (Rat #14160) succumbed in the terminal (13th) week of study and one treated male (Rat #14212) at the 100 ppm. level of (b)(4) succumbed in the 11th week of study.

5. Laboratory Tests:

a. Hematology:

No alterations in the hematologic parameters measured were observed which were considered to be related to treatment with (b)(4).

Group average values are summarized for male rats in Table 12 and for female rats in Table 13. Individual values for all male and female rats appear in Tables 14 through 17).

b. Plasma Biochemistry:

No compound-related changes were found at any period of examination with respect to serum alkaline phosphatase activity or serum glutamic pyruvic transaminase (SGPT) or serum glutamic oxalacetic transaminase (SGOT) activities.

Values obtained in these studies appear in Table 18 through 21.

000103

International Research and Development Corporation

9
Page 10

c. Urinalysis:

Urinalysis examinations failed to reveal changes which were considered to be related to treatment with the test compound. Results of these measurements appear in Tables 22 through 25).

IV. PATHOLOGICAL STUDIES

A. METHODS:

1. Gross Examination:

After 30 and 60 days of compound administration, 3 male and 3 female rats from the control and each treated group were sacrificed by exsanguination and subjected to necropsy examination.

After 90 days of compound administration, 10 male and 10 female rats from the control, 1000, and 5000 ppm. dietary level groups and all surviving rats from the 100 ppm. group were sacrificed by exsanguination and subjected to necropsy examination. Three male and 3 female rats from the control, 1000 and 5000 ppm. groups were sacrificed and subjected to necropsy examination after a 21-day compound withdrawal period. (Other rats that remained on withdrawal beyond 21 days will be reported on in a separate report.)

At necropsy major organs were weighed and representative tissues from each rat were collected into 10 per cent neutral buffered formalin for subsequent histologic processing. At the 90-day sacrifice, specimens of brain, liver, kidneys, muscle, fat, spleen, testes and blood were pooled by sex and dietary group, frozen and forwarded to the sponsor. Specimens of liver from the interim and withdrawal sacrifice were also pooled by sex and dietary group, frozen and shipped to the sponsor.

Rats which died on study were also subjected to necropsy examination unless this was precluded by advanced autolysis.

2. Microscopic Examination:

The following tissues from each of 3 male and 3 female rats from the control and high dosage groups from the 30 and 60-day interim and 21-day withdrawal sacrifices and from each of 10 male and 10

125-016

000105

International Research and Development Corporation

Page 12

female control and high dietary group rats from the 90-day terminal sacrifice were paraffin-embedded, sectioned, stained with hematoxylin and eosin and examined microscopically:

brain	heart	pancreas
spinal cord	spleen	liver
peripheral nerve	lymph node	kidneys
eye	thymus	urinary bladder
pituitary	bone marrow	testes or ovaries
thyroid	salivary gland	prostate or uterus
parathyroid	stomach	skeletal muscle
adrenal	small intestine	skin
lung	large intestine	bone

Sections of liver from 10 male and 10 female rats from the 1000 ppm. level - 90-day sacrifice rats were also processed as above and examined.

B. RESULTS:

1. Gross Pathology (Table 26) and Organ Weights (Tables 27 and 28):

Compound related gross changes observed at necropsy were limited to male rats from the 1000 and 5000 ppm. dietary level groups and consisted of pale, yellowish livers in some but not all male rats from the 5000 ppm. dietary level group and in a few rats from the 1000 ppm. dietary level group.

None of the rats dying on study died of compound related causes. Rat #14160 (Control) died of pneumonia. Autolysis precluded diagnostic necropsy of Rat #14212 (100 ppm.).

Compound related variations in organ weights were limited to the liver and kidneys of treated rats. At the 90-day sacrifice there was a moderate increase in actual and relative liver weights of the 1000 and 5000 ppm. dietary level rats. This increase was also seen in the 5000 ppm. dietary level rats at the 60-day interim

125-016

000106

International Research and Development Corporation

Page 13

sacrifice and in the 2500 ppm. dietary level rats at the 30-day interim sacrifice. After 21 days of compound withdrawal, a slight increase in liver weight persisted at the 5000 ppm. dietary level.

Mean actual and relative kidney weights were slightly in the 1000 and 5000 ppm. dietary level rats at the 90-day sacrifice. Kidney weights were also slightly increased in the 1000 and 5000 ppm. level rats at the 60-day interim sacrifice and 21-day withdrawal sacrifice and in the 500 and 2500 ppm. level at the 30-day interim sacrifice. Although the values from the interim and withdrawal sacrifices represent only 3 rats per sex group, these variations in kidney weights always had a dietary-level relationship.

2. Histopathology (Tables 29 and 30):

Compound related histopathologic changes were found only in the livers of rats from the highest (2500-5000 ppm.) dietary level and consisted of slight hypertrophy of centrilobular hepatocytes. Affected liver cells had cytoplasm which was less coarsely granular and more homogeneous than the unaffected cells at the periphery of the liver lobules and in the livers of rats in the control and lower dietary levels. This change, to a slight degree was seen after 30 days at the 2500 ppm. level. After this group was raised to 5000 ppm., the change was more marked at the 60 and 90-day sacrifices. A very slight change persisted in the 5000 ppm. level male rats sacrificed after a 21-day compound withdrawal period. This liver change was always more marked in male rats and was seen only at the highest (2500-5000 ppm.) dietary level.

No lesions in other organs were considered to have been of compound related origin. No histologic basis was found for the slight increase in kidney weights in treated rats.

Ninety-Day Feeding Study in the Rat.

TABLE 30. Histopathologic Observations. Thirty-Day Interim Sacrifice.

Animal Number	Sex	Tissue	Comment
<u>Control:</u>			
14162	M	liver	Mild portal lymphocytic infiltrate.
14165	M		No lesion.
14168	M	urinary bladder	Seminal plug.
14142	F		No lesion ..
14145	F	lung	Small focus of pneumonic consolidation.
14146	F		No lesion.
<u>2500 ppm.:</u>			
14282	M	liver	Slight hypertrophy of centrolobular hepatocytes.
14285	M	liver	Slight hypertrophy of centrolobular hepatocytes with loss of coarse cytoplasmic granularity.
14288	M	liver	Slight hypertrophy of centrolobular hepatocytes with loss of usual coarse granularity.
		spleen	Moderate hematopoietic activity.
14252	F	liver	Mild portal lymphocytic infiltrate.
		kidney	Mild focal interstitial lymphocytic infiltrate.
14265	F	lung	Moderate peribronchial lymphoid hyperplasia.
14268	F		No lesion.

Ninety-Day Feeding Study in the Rat.

TABLE 30. Continued. Histopathologic Observations. Sixty-Day Interim Sacrifice.

Animal Number	Sex	Tissue	Comment
<u>Control:</u>			
14167	M		No lesion.
14170	M		No lesion.
14178	M	liver	Slight portal lymphocytic infiltrate.
14143	F		No lesion.
14149	F	liver lung	Slight portal lymphocytic infiltrate. Few small scattered foci of pneumonic consolidation.
14152	F		No lesion.
<u>5000 ppm.:</u>			
14289	M	large intestine testes	Nematodes. One testis was edematous and had reduced spermatogenic activity.
		liver	Hypertrophy of hepatocytes which was more pronounced in the centrilobular area; hepatocytes appeared to have higher glycogen content than controls.
14293	M	liver	Moderate hypertrophy of hepatocytes, predominately centrilobular with loss of coarse granularity. Moderate portal lymphocytic infiltrate with scattered small nodules of proliferated reticuloendothelial cells in liver parenchyma.
14295	M	liver	Hypertrophy of hepatocytes, primarily centrilobular, hepatocytes appeared to contain more glycogen than control.
14260	F	liver	Slight hypertrophy of hepatocytes, predominately centrilobular.
14270	F	liver	Slight portal lymphocytic infiltrate.
14275	F	liver	Slight hypertrophy of centrilobular hepatocytes.

Ninety-Day Feeding Study in the Rat.

TABLE 30. Continued. Histopathologic Observations. Ninety-Day Terminal Sacrifice.

Animal Number	Sex	Tissue	Comment
<u>Control:</u>			
14163	M	lung	Moderate perivascular lymphocytic cuffing.
14164	M	urinary bladder	Seminal plug.
14166	M		No lesion.
14169	M	kidney	Small numbers of hyaline droplets in epithelium of convoluted tubules.
		liver	Slight portal lymphocytic infiltrate and bile duct proliferation.
14171	M	lung	Moderate perivascular lymphocytic cuffing with localized pneumonitis.
14172	M	urinary bladder	Seminal plug.
		lung	Slight perivascular lymphocytic cuffing, peribronchial lymphoid hyperplasia.
14173	M	lung	Slight peribronchial lymphoid hyperplasia.
		kidney	Moderate numbers of hyaline droplets in epithelium of convoluted tubules.
14174	M		No lesion.
14175	M	liver	Slight portal lymphocytic infiltrate, centrolobular hepatocytes less coarsely granular.
		lung	Slight perivascular lymphocytic cuffing.
14176	M	liver	Slight portal lymphocytic infiltrate.
		heart	Moderate mural necrosis and perivascular inflammatory infiltrate of a coronary vessel.
14144	F		No lesion.
14147	F		No lesion.
14148	F	liver	Slight portal lymphocytic infiltrate and bile duct proliferation.

(b) (4)

Ninety-Day Feeding Study in the Rat.

TABLE 30. Continued. Histopathologic Observations. Ninety-Day Terminal Sacrifice.

Animal Number	Sex	Tissue	Comment
<u>5000 ppm.:</u>			
14283	M	liver	Centrolobular hepatocytes slightly hypertrophied cytoplasm less coarsely granular than in hepatocytes at periphery of lobules.
14284	M	liver	Centrolobular hepatocytes less coarsely granular than those at periphery.
		lung	Slight peribronchial lymphoid hyperplasia.
14286	M	brain	Glial nodules in medulla, structure resembling <u>Sarcosporidia</u> also present.
		lung	Slight perivasicular lymphocytic cuffing, area of pneumonic consolidation.
		liver	Centrolobular hepatocytes less granular than those at periphery of lobule, slight portal lymphocytic infiltrate.
14287	M	adrenal	Area of osteoid and bone in cortex of one adrenal
		liver	Cytoplasm of centrolobular hepatocytes less coarsely granular than cytoplasm of hepatocytes at periphery, slight portal lymphocytic infiltrate.
14290	M		No lesion.
14291	M	liver	Cytoplasm of centrolobular hepatocytes less coarsely granular than cytoplasm of hepatocytes at periphery of lobules.
14292	M	liver	Centrolobular hepatocytes less coarsely granular than those at periphery of lobules.
		lung	Slight peribronchial lymphoid hyperplasia.
14294	M	liver	Centrolobular hepatocytes less coarsely granular than those at periphery of lobule.
14296	M	liver	Marked portal lymphocytic infiltrate, centrolobular hepatocytes slightly less granular than those at periphery of lobule.

(b) (4)

Ninety-Day Feeding Study in the Rat.

TABLE 30. Continued. Histopathologic Observations, 21-Day Compound Withdrawal.

Animal Number	Sex	Tissue	Comment
<u>Control:</u>			
14177	M		No lesion.
14179	M	pancreas	Small area of necrosis and chronic inflammation.
14180	M	lung liver urinary bladder	Moderate peribronchial lymphoid hyperplasia. Slight portal lymphocytic infiltrate. Seminal plug.
14158	F		No lesion.
14159	F	lung	Moderate peribronchial lymphoid hyperplasia.
14161	F	liver lung	Slight portal lymphocytic infiltrate. Slight perivascular lymphocytic cuffing.
<u>5000 ppm.:</u>			
14298	M	liver lung	Slight portal lymphocytic infiltrate. Mild peribronchial lymphoid hyperplasia.
14299	M	urinary bladder liver	Seminal plug. Centrolobular hepatocytes appeared slightly hypertrophied.
14300	M	liver	Centrolobular hepatocytes appeared slightly hypertrophied.
14278	F	kidney liver lung	Slight interstitial lymphocytic infiltrate, few calcified tubules. Moderate lymphocytic inflammatory infiltrate, primarily in portal areas. Moderate peribronchial lymphoid hyperplasia.
14279	F	liver	Mild portal lymphocytic infiltrate, few scattered vacuolated hepatocytes.
14280	F	lung liver	Slight peribronchial lymphoid hyperplasia. Slight portal lymphocytic infiltrate.
